LECTURE NOTES IN CIS300 YUZHE (RICHARD) TANG SPRING, 2018

SECTION 2: C/C++ PROGRAMMING

REFERENCES

- "Unix Programming Tools", [link]
- Computer Systems: A Programmer's Perspective, Randal E. Bryant and David R. O'Hallaron, Chapter 1, [online pdf]

HELLOWORLD C

```
#include <stdio.h> //preprocessor
int y = 3; //global var. (def. & init.)
//extern int y; //global var. (dec.)
int main() //function (def.)
{
   int x = 0; //local var. (def. & init.), literal,
   printf("helloworld: y = %d\n",y); //function (invocation)
   return 0;
}
```

- printf: format string
- header files

LIFE OF A C CONSTRUCT

	variable	function
declare	extern int x;	<pre>void foo();</pre>
define	int x;	<pre>void foo(){}</pre>
initialize	int $x=6;$	
reference	y=x;x=1;	foo(); (invocation)
destroy		

COMPILATION & EXECUTION: BASICS

- GCC: GNU Compilation Collection
- In your terminal, run the following commands

```
gcc hello.c
./a.out
```

EXERCISES

- Write a C program that prints out your name. Compile and execute it in Ubuntu. Submit the C program to BB.
- Write a C program that computes the sum of 1,2,3,...,956.
 Compile and execute the program in Ubuntu. Submit the C program to BB.

GCC

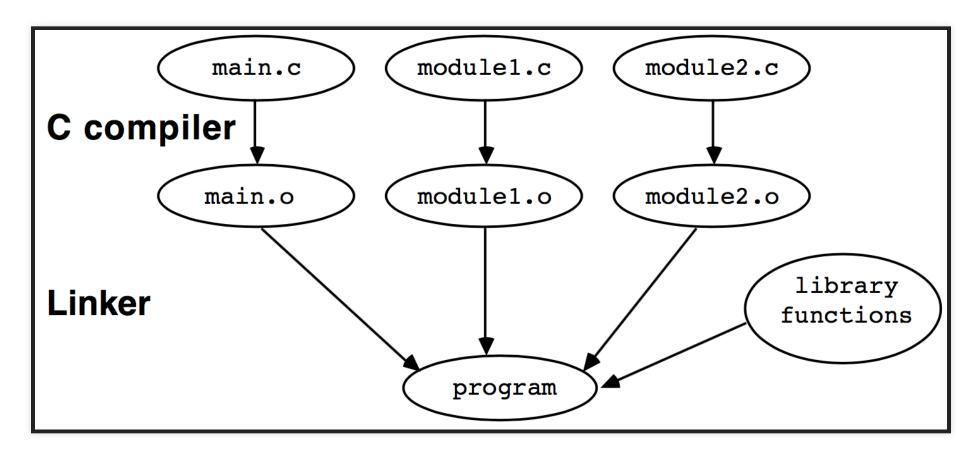

COMPILATION (1)

- Two steps of compilation:
 - compiling: text .c file to relocatable .o (object) file
 - linking: multiple relocatable .o files to one executable .o file
 - symbol: reference to link construct (declaration) in one
 o file to construct (definition) in another . o file

COMPILATION (2)

```
gcc hello.c -o a.out
gcc -S hello.c -o hello.s #compiler
gcc -c hello.s -o hello.o #assembler
gcc hello.o -o a.out #linker
```

- compilation system
 - tools: gcc/gdb for compiling and debugging
 - 1. preprocessor: from source file to source
 - 2. compiler: from source to assembly file
 - assembly file
 - 3. assembler: from assembly file to relocatable object file
 - 4. linker: from multiple objects to an executable object

Linker

COMPILING MULTIPLE C PROGRAMS

In file1.c:

```
#include <stdio.h>
extern void foo();
int main(){
    printf("main();\n");
    foo();
}
```

In file2.c:

```
#include <stdio.h>
void foo(){
    printf("foo();\n");
}
```

COMPILING MULTIPLE C PROGRAMS (2)

```
gcc file1.c file2.c
# try this?
gcc file1.c
gcc file2.c
```

COMPILING MULTIPLE C PROGRAMS (3)

```
gcc -c file1.c # compiler & assembler
gcc -c file2.c # compiler & assembler
gcc file1.o file2.o # linker
```

Or

```
gcc -S file1.c # compiler
gcc -c file1.s # assembler
gcc -S file2.c # compiler
gcc -c file2.s # assembler
gcc file1.o file2.o # linker
```

LINK LIBRARY FILES

```
gcc -S file1.c # compiler
gcc -c file1.s # assembler
gcc file1.o file2.o # linker
```

```
mv file2.o ../libfile2.a
gcc file1.o ../libfile2.a # linker
gcc file1.o -L.. file2.o # linker
gcc file1.c -L.. file2.o # linker
```

• Gcc flag: -Ldir -lmylib for library to link

INCLUD HEADER FILE

In header1.h:

```
extern foo();
```

In file11.c:

```
#include <stdio.h>
#include "header1.h"
int main(){
    printf("main();\n");
    foo();
}
```

```
gcc file11.c file2.c
```

INCLUDE HEADER FILE (2)

Header file in another directory

```
mv header1.h ..
#will this work?
gcc file11.c file2.c
gcc -I .. file11.c file2.c
```

• Gcc flag: -I dir

GCC FLAGS (SUMMARY)

- -c for compile, -o for output
- -Ldir -lmylib for linking a library
 - search library for unsolved symbols (functions, global variables) when linking
- -I for #include
 - header file (storing declarations)
- -Wall, w for warning
- -g for debug (later): gcc -g file1.c file2.c
- ref [link]

EXERCISE

- Write two C files:
 - filea.c defines functions main() and bar()
 - fileb.c defines function foo()
 - function main() calls foo()
 - function foo() calls bar()
 - Compile your program.
 - Submit the program and commands to BB.

MAKE AND MAKEFILE

DOWNLOAD COURSE REPO.

To download course repository, type the following commands

```
sudo apt-get update
sudo apt-get upgrade
sudo apt-get install git
git clone https://github.com/SUCourses/cis300-18spring.git
```

MAKEFILE: DEPENDENCY RULES

- make is a tool for project management in shell
- Makefile is the configuration file that tells the make tool what to do
- A Makefile is a series of dependency rules
- Each dep. rule is a IFTTT clause (if-this-then-that)

target: files/objects
(tab)commands

There is a tab before the commands

HELLOWORLD MAKEFILE

In Makefile (All files are under demos/mar7 dir.)

```
all:
gcc file1.c file2.c
```

To run it, in shell terminal

```
make
```

(Try change file.c, and make it again).

MAKEFILE OF MULTIPLE RULES

```
c:
    gcc file1.c file2.c

exec: c
    ./a.out

clean:
    rm *.o *.out
```

Note there are empty lines btwn. rules.

USE MAKEFILE TO LINK (1)

Recall how to run compiler, assembler and linker

```
gcc -c file1.c # compiler & assembler
gcc -c file2.c # compiler & assembler
gcc file1.o file2.o # linker
```

USE MAKEFILE TO LINK (2)

A Makefile that does them separately

```
link: file1.o file2.o
    gcc file1.o file2.o

file1.o: file1.c
    gcc -c file1.c

file2.o: file2.c
    gcc -c file2.c
```

make make

USE MAKEFILE TO LINK (3)

Use default rule to compile individual C file

```
link: file1.o file2.o
@gcc file1.o file2.o

make
make
```

• @ used to hide the command in printout.

MAKEFILE: USING VARIABLES

```
SRCS = file1.c file2.c
OBJS = $(SRCS:.c=.o)
CFLAGS = -g -Iheaders
#LDFLAGS = -L. -lxxx
link: $(OBJS)
    $(CC) $(LDFLAGS) $(OBJS)
```

MAKEFILE: USING VARIABLES (2)

- A Makefile variable is a text string
- There're standard variables
 - CC is the compiler
 - \blacksquare OBJS = \$(SRCS:.c=.o):
 - This incantation says that the object files have the same name as the .c files, but with .o extension
 - LDFLAGS library search path (-L)
 - CFLAGS default compile flags

EXERCISE

- 1. Write a Makefile such that make always clean .o files, recompiles all .c files and executes the new .o file.
- 2. Write a Makefile such that make link will compile a file.c file against a library file libxxx.a

GDB

REFERENCES

- "Reviewing gcc, make, gdb, and Linux Editors", [pdf]
- "Unix Programming Tools", [link]

A BUGGY C PROGRAM

```
#include<stdio.h> //printf
int array_stack[] = {0,1,2};
int main(){
  int sum; // local variable
  for(int i=0; i<=3; i++){
    sum += array_stack[i];
  }
  printf("sum = %d\n", sum);
  return 0;
}</pre>
```

USE GDB TO FIND BUG

- Installing gdb
 - on MacOS: [youtu.be/Vj33vsrDkE80]
 - on Ubuntu: sudo apt-get install gdb
- Compile: gcc -g
- Run gdb: gdb a.out

GDB COMMAND: CONTROL EXECUTION

- CPU executes a C program statement by statement
- Breakpoint: tell where the CPU should stop/pause execution
 - break/b file:n|fn|file:fn
 - disable/enable/delete bkpt: bkpt=file:n|fn|file:fn
- Stepping: tell CPU to resume the execution
 - run/r:run
 - next/n: next statement (step over a function call)
 - continue/c: continue till breakpoint

GDB COMMAND: EXAMINE RUNTIME

- Examine runtime data
 - print v/p v: print variable v
- Examine code (with gcc -g)
 - list/l
- Examine execution environment: e.g. stack (later)

GDB COMMANDS

functionality	commands	
breakpoints	b,disable/enable/delete breakpoi	
stepping	r,s,n,c,finish,return	
examine_data	p/i v,display/undisplay,watch,set	
examine_code	list	
examine_stack	bt,where,info,up/down,frame	
misc.	editmode vi,b fn if expression,h disassembler,shell cmd	

DEMO

Debug the following program using gdb

```
#include<stdio.h> //printf
int array_stack[] = {0,1,2};
int main(){
  int sum; // local variable
  for(int i=0; i<=3; i++){
    sum += array_stack[i];
  }
  printf("sum = %d\n", sum);
  return 0;
}</pre>
```

EXERCISE

• Exercise: Debug the following program using gdb, upload the correct program to BB.

```
#include<stdio.h>
int main() {
    int x = 5;
    int y = 3;
    int z = x - y;
    int a = x * y;
    int b = a - 7*z;
    b--;
    int c = z + y;
    int d = c / b;
    int e = a + 12;
    int f = e - b;
    printf("%d\n",f);
}
```
